

WIRELESS HOT SPOTS

THE PATH TO HIGH-SPEED WIRELESS INTERNET ACCESS

A Publication of Applied Wireless LAN, Inc.

VOL. 1 • No. 1

What is Wi-Fi™?

Put simply, Wi-Fi™, or Wireless Fidelity, is freedom. It's independence. It's high-speed Internet access without the constraints of cables or wires. Wi-Fi™ allows you to connect to the Internet from your couch at home, a bed in a hotel room, or a conference room at work without the

inconvenience of wires. Wi-Fi™ technology is similar to that of a cordless phone—a small base station permits the end-user to roam about a limited distance and remain connected. More importantly, Wi-Fi™, whose official name is Wireless Local Area Network (WLAN), allows several individuals to share one broadband connection at no additional cost and without pulling cumbersome cables.

Sharing Cable/DSL Using Wi-Fi™

The most popular application today shares a single high-speed Internet jack (cable/DSL) among several home/office computers. With a WLAN, there is no more hogging the Internet by one person. In an apartment or home office, using Wi-Fi™ equipment in your network gives each individual the ability to surf the Web, play games, stream video, and share files, simultaneously. A Wi-Fi™ network can easily share cable/DSL connections among 10 to 15 users.

For more information about Wi-Fi™ technology or to have your WLAN installed today,
call 301-424-6857 or email Sales@AppliedWLAN.com.
